

A Smart Health Records Application

USING MACHINE LEARNING FOR
PERSONALIZED, INTERACTIVE HEALTH

Smart Health Records App

Outline

- **Business Problem**
- **Data Understanding**
- **Models**
- **Results**
- **Recommendations**

Smart Health Records App

Business Problem

- Multiple health networks create incomplete, spotty health records. Increased uncertainty, conflicting treatments/procedures.
- Medical Records Database aggregates and combines patient records across healthcare systems
- We will demonstrate the app's value with a simple scenario involving predicting vaccination status

Smart Health Records App

Vaccination Scenario Data Understanding

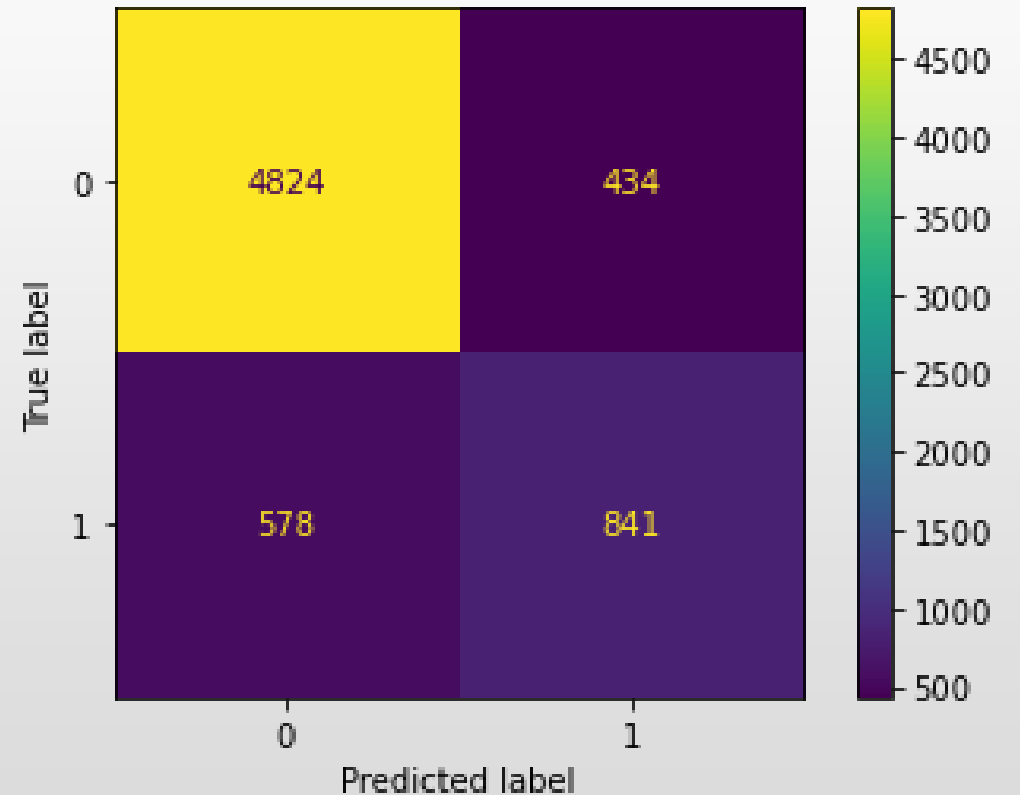

- Data from National Center for Health Statistics
- Survey data taken during 2009 H1N1 flu pandemic
- Shows number of vaccinated and unvaccinated for H1N1 vaccine
- Training Data column = actual classes
- Predicted Data = predicted classes

Class	Training Data	Predicted Data
Did not take vaccine (0)	21033	22970
Took vaccine (1)	5764	3738

Smart Health Records App

Vaccination Scenario: Logistic Regression Model

- Basic binary classification algorithm
- Handles majority class (unvaccinated) very well, minority class reasonable
- Logistic Regression Accuracy Score: 85%

Confusion Matrix for Logistic Regression Model

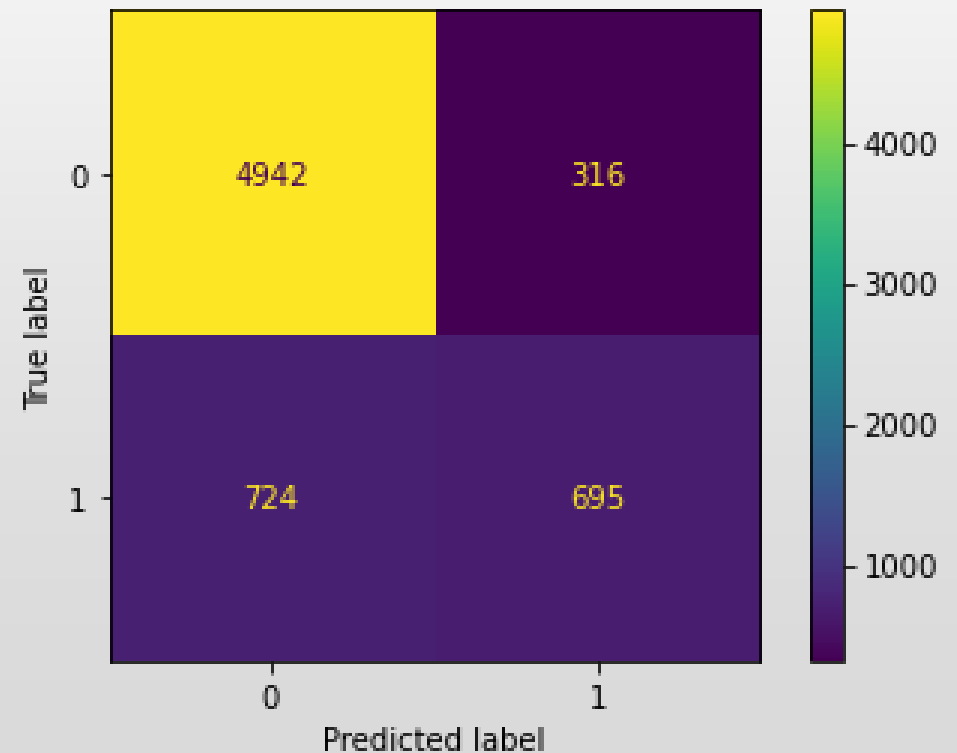

Smart Health Records App

Vaccination Scenario: SVM model

Notes

- SVM are more complicated models that are often quite accurate
- Results similar to previous model
- SVM Accuracy Score: 84%

Confidence Matrix for Support Vector Machine Model

Smart Health Records App

Vaccination Scenario: Gradient Boosting Classifiers

GradientBoostingClassifier

Accuracy: 85%

XGBClassifier

Accuracy: 83%

Smart Health Records App

Vaccination Scenario: Predictive Modeling Results

- All models performed similarly, with accuracy ranging from 77-85%
- Results suggest prediction improvement with increased data and features
- The application would send vaccination reminders and recommendations to the correctly classified patient 85% of the time

Model	Accuracy (%)
Logistic Regression	85%
Support Vector Machine	84%
Decision Tree	77%
Random Forest	84%
XGBClassifier	84%
Gradient Boosting Classifier	84%
Gradient Boosting Classifier (post-tuning)	85%

- Data

- Does not include social network data or patient history.
- Include data from many other sources.
- Develop synthetic data to model effect of social network on medical decisions

- Models

- Explore other models (Naïve Bayes, K-Nearest Neighbor, for example) or even clustering techniques.
- Develop ensembles and or voting models

- Future Work

- Integrate other data streams into predictive models
- Develop UX/UI and backend

Smart Health Records App

Shortcomings, Limitations, and Future Directions

A doctor in a white lab coat and blue tie is holding a black smartphone. A hand is pointing at the screen of the phone. The background is a light blue gradient.

Thank you!
